My interest in mathematics blossomed early, yet it was the discovery of the mathematical universe that launched my interest into a new territory. In search of the place where mathematics and the physical sciences meet, I searched for the last frontier, the mathematical realm, which, I imagined, the human mind could reach. The more I learned, the more I wanted to learn and the more intense my curiosity became. I wanted to know everything, and discovered that there was almost nothing left to know. I discovered that mathematical knowledge, like all knowledge, is in the end finite. With my love of

mathematics as a central theme, I began working on my dissertation. My thesis subject was the history of non-Euclidean geometry. I began at the beginning, working through ancient history and culminating with Hilbert's deep insights into the subject. In my research, I discovered that the significance of non-Euclidean geometry was much greater than the relative paucity of evidence may indicate. Many important discoveries have been made from exploring the rich diversity of non-Euclidean geometries. At last I began to understand the beauty of mathematical discovery. Its intuitive concepts presented themselves to me, some requiring major efforts, others less. The geometry I explored, until I understood its nature, the concepts I presented and the mathematical proofs I found all seemed to have no special merit. All of a sudden I found myself immersed in the beauty of mathematics. In time I found a new frontier in mathematical discoveries to explore. The past 30 years have been an explosion of discoveries in several areas of mathematics that have expanded and enriched our understanding of mathematics. One particularly active area is the new field of mathematical logic, and more particularly mathematical model theory, which is developing a new approach to the traditional Euclidean system. It is now possible to use new mathematical logic to investigate mathematical systems of infinite complexity and, in the process, discover a whole new realm of mathematical constructions and structures. The mathematical universe is no longer limited by the traditional mathematics. With new mathematics, comes new mathematics. With the new mathematics, come new surprises, new insights, and new discoveries. The discovery of a new mathematical universe is not merely a
